SUMMARY

Software developer with five internships totalling three years at McKesson, CAE and Presagis, combining technical fluency with stakeholder communication. Builds automation and decision-support tooling that removes manual steps from production workflows — a four-hour recurring task cut to thirty minutes, approval steps automated out of business decision flows Direct experience with ETL, execution.

SKILLS

Technical: ETL, Python, SQL, Power BI, Excel, .NET, JavaScript, PowerShell, data pipelines

Analysis: Stakeholder communication, process automation, data governance, reporting and dashboards, cross-functional collaboration

AI: LLM APIs, retrieval-augmented generation (RAG), workflow automation, decision-support tooling

Tools: Git, Jira, Docker, CI/CD, MongoDB, AWS, Google Cloud Platform

EXPERIENCE

McKesson · Software Developer — Aug 2026 – Dec 2026

Contract extension

- Designed the retrieval layer that makes the meeting corpus semantically searchable, so the agent answers questions grounded in past meetings rather than from the model alone
- Continued from a summer internship automating manual approval steps in production decision workflows
- Building a retrieval-augmented (RAG) AI agent for the AI Canada team: an ingestion pipeline that turns recorded video calls into structured transcripts, keyframe snapshots and generated summaries
- Integrated LLM inference APIs into production business workflows over REST services in Python and .NET

McKesson · Software Developer Intern — May 2026 – Aug 2026

- Integrated Python and .NET AI modules into production decision workflows, automating routine approvals and lowering manual decision effort for business teams
- Worked within enterprise cybersecurity standards to support secure production applications handling customer and employee data
- Built internal iOS applications in Swift that enforced data-privacy policy, reducing exposure of sensitive information and enabling compliant data handling for internal stakeholders

CAE · Cloud Engineer Intern — May 2025 – Aug 2025

- Built PowerShell automation that diffs Git-versioned virtual assets across environments and summarises configuration drift, increasing data-governance coverage by 35%
- Generated an interactive HTML report tracing asset relationships and configuration differences, shortening asset review cycles for simulation stakeholders

CAE · Software Developer Intern — Sep 2024 – May 2025

- Engineered an XML-based developer-productivity extension with reusable tooling that cut a recurring four-hour task to thirty minutes and standardised release workflows
- Implemented simulation algorithms in Python under Git-based workflows, improving runtime stability and reducing defects caught during test runs

CAE · Software Engineer Intern — Aug 2023 – Sep 2024

- Built C++ pipelines for real-time sensor streams with validation and automated unit tests, reducing data inconsistency by 20%
- Improved simulation platform performance by up to 15% by profiling and refactoring C++ and Python sensor-processing modules around the Strategy pattern

Presagis · Simulation Developer Intern — May 2022 – Jun 2023

- Partnered with NVIDIA research on 3 internal reports covering machine-learning point-cloud workflows for robotics, demoing prototypes to guide roadmap decisions
- Prototyped an NVIDIA Omniverse digital-twin pipeline automating asset preparation, reducing manual modelling hours by 25%

PROJECTS

EDUCATION

Concordia University · Bachelor of Computer Science — Sep 2022 – Sep 2026

Marianopolis College · Associate's, Business — Sep 2020 – Jun 2022
